

SOLAR PHOTOVOLTAIC ENGINEERING SERVICES

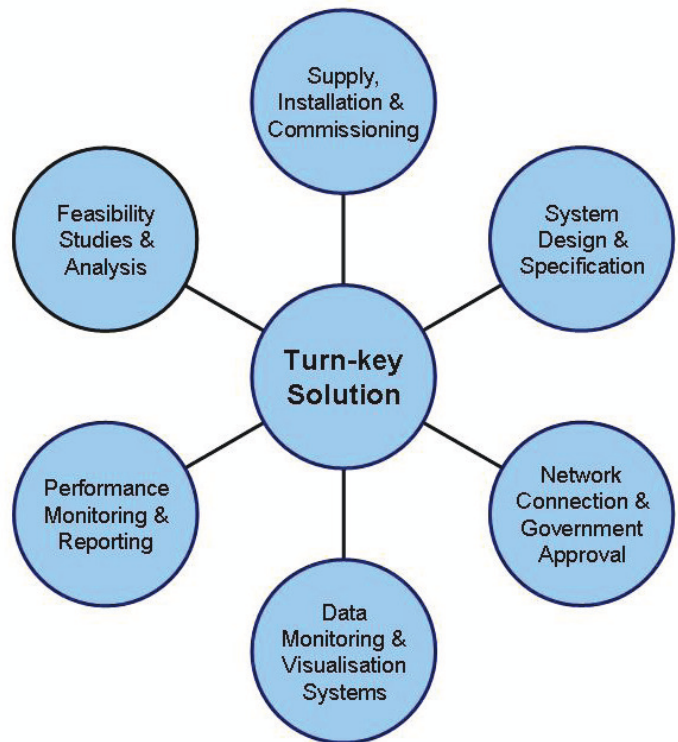

Solar Photovoltaic Engineering

Autonomous Energy is an industry leader in the Australian solar photovoltaic (PV) engineering industry. We design, supply and install grid connected and autonomous solar power systems with our renewable energy engineering team and our in house solar installation team. We operate across a broad range of market segments including residential, commercial, educational, government, construction and industrial. Autonomous Energy provides the full spectrum of solar engineering services. We have numerous reference sites demonstrating the superior performance of our systems and our ability to integrate systems in a diverse range of site specific conditions.

We conduct feasibility assessments into the potential to integrate renewable energy technology as on site generation of clean energy at your facility, shading analysis to determine the actual solar resource available, PV system electrical design, array layouts, module tilt angles, cable & switch gear selection, module and inverter specification, network approval and connection, government approvals, tender management, as well as installation and commissioning of turn-key solar PV systems to meet your particular requirements. We also offer comprehensive PV system data monitoring and visualisation systems that display renewable energy system performance in the office, public area, classroom or online.

Turn-key Projects

Autonomous Energy has a strong track record in delivering turn-key solar PV systems with a large number of successfully completed commercial projects since 2003. We combine all of the technical engineering and practical expertise required to provide the complete range of services needed for successful commercial PV systems. All our installations are performed by our own experienced, in house installation team consisting of licensed electricians, accredited installers and PV solar engineers. All members of our team share a common commitment to quality which combined with our strong level of technical expertise ensures that Autonomous Energy solar power systems are of the highest quality available and will continue to perform well for decades to come. We don't cut any corners during installation and pay as much attention to the 'nuts and bolts' as the major components; our philosophy is that installation quality is as important as the quality of the major components.
